

# Can I explain and use ratio notation?

## Teaching guidance

### Key vocabulary

ratio, for every, to every, equivalent, simplify, problem, pattern, relationship, scale up/down

### Models and images and resources

#### Ratio and proportion ITP

This program enables you to set the ratio for yellow: pink liquid that is poured into two measuring cylinders. This provides a visual image for the relationship between two quantities in this ratio.

A scale factor can be used that scales up the amount of each colour poured in.

#### Fraction ITP

This program allows you to break a strip into different parts and to colour some of the parts yellow. The program can display the ratio of yellow to green parts.

#### Area ITP or tiles or squared paper

Rows of coloured tiles or squares can be displayed in a given ratio to create a sequence of equivalent ratios.

3 orange:2 pink  
6 orange:4 pink  
9 orange:6 pink...

#### Number lines or counting stick

A sequence of equivalent ratios is produced when a given ratio is scaled up by a factor of one, then two, then three...

This can be represented on a number line or counting stick.

Encourage children to describe the patterns within the sequence.

## Teaching tips

- Ratio can describe a part to part relationship. For example:
  - The ratio of girls to boys in a class is two to every three (represented as 2:3).Ratio can also describe the relationship between two comparable quantities/measures:
  - The ratio of a distance on a map to the distance on the ground is 1:10 000.
- Provide visual images for ratios then ask children to describe the scenario using the language and notation of ratio, and vice versa:

- Each cone has two scoops of chocolate ice cream to every one scoop of strawberry.
- Ensure that children understand and can use ratios described in different ways:
  - Using everyday language: there is one black tile to three white tiles; there is one black tile for every three white tiles.
  - Using a colon (use everyday language first, then the colon form):  
The ratio of black tiles to white tiles is one to every three.  
The ratio of black tiles to white tiles is 1:3.  
The ratio of white tiles to black tiles is 3:1.
- Ensure that children can use and describe ratios in their simplest form, for example 1:3 is the simplest form of the relationship 3:9.
- Demonstrate how ratios can be simplified in a similar way to fractions:

12 yellow:8 red

3 yellow:2 red

The following activity/activities available via the NRich site can be used to support use and application of mathematics associated with this Can I sequence.
